

P-120 vNext

Scientific Architecture of P-120: Core Profile and Extended Research Program

Scientific Concept Paper · Public Research Edition · v1.2

FIELD	PUBLIC MEANING
Status	Research Candidate · 18+
Date	1 September 2026
Purpose	Public scientific overview of the P-120 system and its research program.
Limitation	Not a clinical, diagnostic, normed, or predictive instrument.

EVIDENCE STATUS	Scientific publications support adjacent mechanisms, measurement precedents, and individual hypotheses. They do not constitute direct empirical validation of P-120 as an integrated system. P-120 remains a Research Candidate.
-----------------	--

PUBLIC SCOPE	This edition is intended for users and external readers. It explains the scientific logic, boundaries, and development program, but does not publish item banks, scoring keys, thresholds, internal scientific-adjudication registries, technical schemas, or restricted interpretation rules.

Abstract

P-120 vNext is a research system designed to describe how different aspects of a person's erotic and intimate experience are organized without reducing them to a single overall score. The Core profile separates erotic-aesthetic activation, desire durability over time, regulation of significant attachment, social-affective touch, and subjectively experienced embodied erotic response.

Following development of the Core profile, the research program expanded: separate modules are being developed for erotic communication, sexual motivation, sexual self-relation, and specialized preference/reward architecture. LIFE is developed separately as an outcome/spillover layer examining broader states observed around and after intimacy. These extensions do not recalculate Core P-120 and do not form a single "Extended Total."

P-120 remains a Research Candidate. Its current scientific position is original candidate integration and operationalization: an original candidate integration and operationalization of several established or adjacent research traditions within a differentiated, testable system. Priority or "first-ever" claims are not made without a separate systematic review of comparable instruments.

Keywords: erotic architecture; sexual desire; aesthetic responsiveness; novelty; habituation; partner responsiveness; attachment; social touch; interoception; motivation; communication; sexual self-relation; outcome/spillover; psychometrics.

POSITIONING

P-120 does not claim to have discovered a universal structure of sexuality. It proposes a high-resolution research architecture whose distinctions must withstand cognitive, psychometric, external, longitudinal, and, where appropriate, dyadic testing.

1. What P-120 Is Today

P-120 is being developed as a modular research system. Its foundation is Core P-120: five independent layers already prepared for controlled pilot research. Above the Core, an Extended Test Package is being developed as a set of independent deep-dive modules that examine adjacent questions without changing the source results of the Core profile.

This separation is fundamental. In P-120, the questions "what activates?", "how does desire change over time?", "why does a person choose intimacy?", "how do they communicate and negotiate erotically meaningful information?", and "how do they experience themselves as a sexual subject?" belong to different research territories. Overlap among them is an empirical question, not a reason to combine them in advance into a single score.

LAYER	PRIMARY QUESTION	PUBLIC STATUS
CORE	How are activation, durability, attachment, touch, and embodied response organized?	Research Candidate · prepared for controlled pilot research
EXTENDED	How does a person communicate, why do they choose intimacy, how do they relate to themselves, and how are specialized preferences organized?	Developed modularly; public information is summary-level only
OUTCOMES	What broader states are observed around and after intimacy?	Candidate outcome/spillover research; no causal claims
METHODS	How are constructs, distinctions, and external validity tested?	Shared validation program
LIBRARY	Which peer-reviewed studies and methodological sources support the program?	Public Scientific Library
NON-REDUCTION	P-120 does not authorize a global “sexuality number,” a P-120 Extended Total, or an automatic couple-compatibility percentage based on one person’s data.	

2. Scientific Problem: Why One Score Is Not Enough

Contemporary literature already distinguishes aesthetic responsiveness, visual sexual response, sensory imagery, holistic and local body processing, biological motion, social and affective touch, sexual excitation/inhibition, novelty and boredom, partner responsiveness, attachment, interoception, sexual assertiveness, and sexual-script flexibility. Yet these processes are often studied with different instruments and within different disciplinary languages (Rupp & Wallen, 2008; Schlotz et al., 2021; Trotter et al., 2018; Mark & Lasslo, 2018; Mehling et al., 2018).

P-120 starts from a measurement hypothesis: it is useful to test configurations of partially separable processes rather than assume a single continuum in advance. A person may place high value on aesthetic form without rapidly transitioning into arousal; respond to novelty while sustaining it within a familiar relationship; need vivid partner responsiveness without needing joint scene construction; and notice their own bodily signals well while remaining selective about ordinary social touch.

This architecture is not defended as dogma. If future data show that particular distinctions do not replicate, constructs should be merged, redefined, or removed. The scientific value of the system depends on its ability to become simpler under empirical pressure.

3. Core P-120: Five Independent Research Layers

MODULE	WHAT IT EXAMINES	WHAT IT DOES NOT CLAIM
SAT-24	How ordinary non-erotic interpersonal touch acquires emotional and bodily meaning.	Does not measure consent, objective tactile sensitivity, or attachment style.
P-72	Which aesthetic, perceptual, sensory, novelty-related, and relational mechanisms organize erotic-aesthetic activation.	Is not a catalogue of orientations, practices, or a “sexuality type.”
P-72D	How already-emergent desire changes with familiarity, repetition, closeness, sexual enactment, disruptions, and repair.	Does not automatically predict relationship duration or infidelity.
AO-12	How significant closeness, uncertainty, and reliance on another person are regulated along dimensional coordinates.	Does not diagnose attachment style or trauma.
SOMA-24	How a person notices, differentiates, and experiences their own embodied erotic response.	Does not measure objective interoceptive accuracy or sexual function.

The layers may converge or diverge. Both patterns may be informative. Integration should connect source profiles without overwriting them or averaging them into a global total score.

3.1 P-72 — Erotic-Aesthetic Activation

P-72 examines mechanisms that capture attention and organize involvement: aesthetic responsiveness, the transition from beauty to erotic activation, visual-haptic simulation, global and local form processing, the influence of light and viewing angle, movement dynamics, real multisensory input, expressive intensity, novelty, erotic reciprocity, and co-creation of atmosphere.

The distinctions between adjacent mechanisms are scientifically important. Beauty need not become arousal; a visually evoked quasi-tactile sensation is not the same as a need for actual touch; intensity may remain strong under familiarity while novelty is subtle; and partner responsiveness is not identical to joint erotic co-authorship.

3.2 P-72D — Desire Durability Over Time

P-72D shifts the focus from initial “chemistry” to the dynamics of desire once it has emerged.

Research interest includes within-partner novelty regeneration, dependence on external renewal, familiarity and habituation, self and partner erotic agency, the capacity to recover after disruption, changes after sexual enactment, and the interaction of closeness with eroticism.

Research on long-term relationships, self-expansion, and sexual boredom indicates that desire over time is heterogeneous and depends on context, novelty, routine, and interactional features (Mark &

Lasslo, 2018; Muise et al., 2019; de Oliveira et al., 2021). P-72D translates these lines of work into a candidate measurement architecture that still requires direct validation.

**SCIENTIFIC
BOUNDARY**

High novelty responsiveness does not automatically mean a need for a new partner. P-120 deliberately leaves this distinction as an empirical question.

3.3 SAT-24 — Social-Affective Touch

SAT-24 establishes a non-erotic baseline. It considers the affective value of ordinary touch, subjectively noticeable bodily resonance, the dependence of meaning on relationship and context, and bodily response to touch that does not fit a personal boundary. Research on social touch shows that its meaning cannot be reduced to skin sensitivity alone (Trotter et al., 2018; Gallace & Spence, 2010; Saarinen et al., 2021).

3.4 AO-12 — Attachment Regulation

AO-12 uses a contemporary dimensional model of adult attachment: anxious activation and avoidant deactivation/reduced reliance are treated as continuous coordinates rather than mandatory fixed types. This logic is consistent with ECR/ECR-RS traditions and relationship research (Fraley et al., 2000, 2011).

AO-12 helps prevent erotic autonomy, distance, or sensitivity to closeness from being explained by attachment alone. Associations between AO and the erotic modules should be evaluated empirically.

3.5 SOMA-24 — Embodied Erotic Response

SOMA-24 shifts attention to the respondent's own body: noticing erotically meaningful bodily changes, understanding their meaning, the subjective capacity to alter state through attention, breathing, or movement, and factors that may attenuate accessible bodily response. Research emphasizes that subjective and physiological arousal are not the same measure and that interoceptive self-report is multidimensional (Chivers et al., 2010; Mehling et al., 2018).

4. Extended Research Program

After Core P-120 was established, the research program expanded toward adjacent questions that matter for a fuller description of experience but should not contaminate the Core profile. Extended Research Systems are designed as independent optional modules: a user may complete them separately, and the absence of a module does not imply a zero or low result.

AVAILABILITY

Mention of a module in this document does not mean that it is already available as a final user-facing test. Extended modules become publicly available gradually as they complete their own scientific and publication stages.

4.1 Extended Research Systems

MODULE	PUBLIC RESEARCH QUESTION	CURRENT BOUNDARY
COM-12 · Erotic Communication Architecture	How does a person express, receive, clarify, negotiate, and repair sexually or erotically meaningful communication?	Research Candidate. The cognitive field protocol is prepared; the final factor model and scoring rules are not confirmed.
MOT-12 · Sexual Motivation Architecture	Why, or for what psychological outcome, does a person choose sexually or erotically meaningful intimacy?	Research Candidate. The candidate architecture is undergoing content, expert, and cognitive review; the factor structure remains open.
SELF-12 · Sexual Self-Relation Architecture	How does a person experience, evaluate, and author themselves as a sexual subject?	Research Candidate. A candidate dimensional architecture is under development; a single SELF total score is not authorized.
RPE-MOD · Specialized Preference / Reward Architecture	How are specific psychophysical preferences and reward-related coordinates organized when a more specialized deep dive is needed?	Research Candidate. The adaptive architecture is under development; final scoring rules and norms are not established, and no pilot version has been frozen.

These modules do not alter Core P-120 and are not summed into a P-120 Extended Total. Their future value must be supported not only by internal structure but also by incremental validity: each module should demonstrate what information it adds after accounting for the nearest existing P-120 layers.

4.2 LIFE — A Separate Outcome / Spillover Layer

LIFE-12/18 is conceptually separated from psychosexual trait modules. Its question is which broader affective, energetic, cognitive, restorative, engagement-related, or meaning-related states are observed around and after intimacy. It is research on outcomes and associated changes (outcome/spillover), not a measure of “sexual energy,” general well-being, or sexual personality.

Causal discipline is especially important for LIFE: co-occurring changes in intimacy and sleep, mood, recovery, rumination, or engagement do not establish that one causes the other. Until appropriate

longitudinal or experimental data are available, only the language of covariation and temporal association is warranted.

5. How the Scientific Evidence Base Is Organized

As P-120 grows, its scientific evidence base can no longer function as one long bibliography. The research program organizes evidence into distinct sub-bases: Core, Extended, Outcomes, Methods, and the Scientific Library. This allows the system to expand without losing boundaries or visually and conceptually mixing different levels of evidential support.

LEVEL	WHAT IT MEANS FOR THE READER
Established adjacent science	The phenomenon or measurement principle has established scientific support outside P-120.
Adjacent evidence / scientific precedent	Related studies and instruments exist, but they do not validate the exact P-120 operationalization.
Candidate operationalization	P-120 formulates its own measurement approach, which must undergo direct testing.
Research level	The hypothesis or architectural decision is retained only as an object of further research.

The same scientific publication may be relevant to several modules, but this does not create multiple independent confirmations. The public Scientific Library should use one deduplicated reference registry and indicate the scientific territories to which each source is relevant.

6. Evidence and Originality Discipline

P-120 originality is stated narrowly as original candidate integration and operationalization. This means that the program proposes its own candidate measurement architecture integrating several scientific traditions that are more often studied separately, while preserving their boundaries and allowing that some new operationalizations may not survive empirical testing.

- P-120 is not described as the “world’s first” instrument without a separate systematic review of comparable systems.
- Peer-reviewed studies of adjacent mechanisms are not described as “validation of P-120.”
- An engineering-convenient composite does not become a scientific construct merely because it can be calculated.
- An elegant or psychologically compelling profile cannot carry a higher level of evidential certainty than the data on which it is based.

7. What P-120 Tests Empirically

P-120 is valuable only to the extent that its key distinctions can be falsified. The public-facing priority is not every internal technical hypothesis, but several central testable propositions:

- aesthetic perception and erotic activation will be related but not identical;
- visual-haptic simulation will differ from the incremental effect of real multisensory input;
- intensity and novelty will emerge as distinguishable sources of involvement;
- novelty responsiveness need not imply dependence on a new partner;
- erotic autonomy and attachment avoidance may correlate but should not automatically collapse into one factor;
- social bodily resonance and erotic bodily noticing may share some variance without collapsing into one “general sensitivity” factor;
- initial activation and desire durability will be related but not isomorphic;
- actual compatibility of a specific couple requires data from both partners and should not be inferred from one individual profile.

If these distinctions do not replicate, the model should be simplified. If an Extended module adds no information beyond the nearest existing layer, shortening, merging, or abandoning that module is a scientifically appropriate outcome.

8. Validation Program

The validation program is staged and does not assume that a preferred theory must be “proved” at any cost. The principal stages are:

STAGE	PUBLIC PURPOSE
1 • Content / response process	Do respondents understand the wording and distinctions as intended?
2 • Pilot item functioning	Do response categories, N/A, missingness, and distributions function without systematic defects?
3 • Structural testing	Are the proposed multidimensional structures supported better than simpler alternatives?
4 • Reliability / stability	How stable are scores within a session and over time under stable context?
5 • Convergent / discriminant validity	Are scores associated with related external measures while remaining distinct?
6 • Method-specific calibration	Do comparative or adaptive components require specialized psychometric calibration?
7 • Experimental criteria	Can key adjacent mechanisms be distinguished in controlled tasks?

STAGE	PUBLIC PURPOSE
8 • Longitudinal / event-based data	Do durability and outcome measures describe real dynamics over time?
9 • Invariance / DIF	Is the measurement structure preserved across languages, groups, and administration modes?
10 • Dyadic research	How do the needs and capacities of two partners interact without a pseudo-precise compatibility percentage?
11 • Independent replication	Does the structure replicate outside the development team?

Until these stages are completed, the Research Candidate status must remain visible. Any transition to validated, standardized, or normed language requires appropriate empirical evidence and a separate scientific decision.

9. What Results Can and Cannot Mean

CAN	CANNOT
Describe a multidimensional profile of the mechanisms under study.	Diagnose a condition or label a person “normal/abnormal.”
Compare mechanisms within a profile when the specific instrument version permits it.	Infer sexual orientation, trauma, moral maturity, or health.
Use the profile as a language for self-observation and as a research hypothesis.	Treat bodily response or arousal as consent.
In future research, examine interactions between two profiles using dyadic data.	Report a real couple-compatibility percentage from one person’s data.
Record the absence of relevant experience as N/A.	Interpret N/A as low functioning.

INTERPRETIVE RULE

A high or low score is not an evaluation of a person’s worth, maturity, health, masculinity/femininity, or quality as a person.

10. Ethics, Privacy, and Consent

P-120 is intended only for adults aged 18+ participating voluntarily. Consent is an independent legal and ethical category: it is not inferred from arousal, bodily response, preference, intimacy, or any psychological score.

Formal research requires minimization of identifying data, transparent rules for storing and deleting sensitive information, access controls, the ability to withdraw participation, and, where

applicable, independent ethics review. This public scientific document does not disclose internal participant identifiers, technical storage architecture, or operational security details.

Interpretation should be traceable to measured data and should clearly distinguish measured, derived, interpretive, and research-level content. Literary or human-centered report language cannot increase the level of scientific certainty.

11. Limitations and Revision Criteria

The principal limitations of any current P-120 profile include self-report bias, social desirability, retrospective reconstruction, availability of relevant experience, context and administration-mode effects, possible overlap among adjacent constructs, and the risk that a compelling narrative may be perceived as more precise than the data warrant.

New Extended modules introduce an additional risk of construct proliferation: expansion is justified only when a new scale or domain contributes independent information. The system architecture therefore includes boundary audits, tests of incremental information value, and explicit publication constraints.

FAILURE IS INFORMATIVE

If constructs cannot be distinguished, do not replicate, or provide no incremental information, the scientifically appropriate result is to simplify the system rather than defend the original architecture.

12. Research Program Outlook

P-120 is not developing toward an unlimited number of tests, but toward controlled modularity. Core covers the foundational architecture of activation, durability, attachment, touch, and embodied response. Extended modules are designed for independent deeper assessment of communication, motivation, self-relation, and specialized preferences. LIFE remains a separate outcome/spillover direction.

For users, this means potentially more precise language without requiring completion of every module. For research, it enables testing not only individual scales but also their incremental information value, cross-layer associations, temporal dynamics, and, in the future, actor-partner effects. For development, it requires preserving modular boundaries while allowing new data to change the architecture.

13. Conclusion

P-120 vNext should be understood as a developing research architecture rather than a completed theory of human sexuality. Its strength is the separation of processes that everyday language often

conflates: beauty and arousal, activation and durability, novelty and external dependence, closeness and autonomy, social touch and erotic embodiment, desire and motivation, internal experience and communication, and psychosexual architecture versus broader life outcomes.

The current scientific status remains Research Candidate. Core is ready for controlled pilot testing; Extended Research Systems and LIFE are developing along their own validation pathways and are published only within the limits permitted by their evidential maturity. The most important next output for the program is not a stronger narrative but data: cognitive, psychometric, external, longitudinal, invariance, and dyadic.

BOTTOM LINE

P-120 offers not a finished answer about a person, but a system of testable questions about how attraction, desire, closeness, embodied response, and adjacent processes are organized.

Scientific and Methodological References

The bibliography is retained from the public P-120 v1.1 scientific corpus. It represents scientific and methodological sources supporting the adjacent mechanisms and measurement decisions discussed here; its inclusion does not constitute direct validation of P-120.
